

Ganglion Cyst Removal

Ganglion cyst

Overview

This procedure treats a fluid-filled lump called a "ganglion cyst." This type of cyst forms near a joint. We often see it at the wrist.

Preparation

To begin, we give you medicine to numb the area. Then we make a small incision in your skin to get to the cyst. The cyst is a sac of fluid on a thin stalk. The stalk attaches to something near it. It may be attached to a joint capsule or a ligament. It may be attached to a tendon sheath.

Removing the cyst

We find the base of the stalk and cut it. Then we remove the cyst and the stalk. We may use sutures to repair the place where the stalk was attached.

End of procedure

When it's done, we close and bandage your skin. You may wear a splint as you heal. Follow your care plan for a safe recovery.
